## INSTRUCTIONS:

1. This examination consists of a total of 9 different pages. The last three pages include a periodic table, some useful mathematical equations, a solubility table and a table of equilibrium constants. All work should be done in this booklet.
2. PRINT your name, TA's name and your lab section number now in the space at the top of this sheet. DO NOT SEPARATE THESE PAGES.
3. Answer all questions that you can and whenever called for show your work clearly. Your method of solving problems should pattern the approach used in lecture. You do not have to show your work for the multiple choice or short answer questions.
4. No credit will be awarded if your work is not shown in problems 3, 5, 6b and 7.
5. Point values are shown next to the problem number.
6. Budget your time for each of the questions. Some problems may have a low point value yet be very challenging. If you do not recognize the solution to a question quickly, skip it, and return to the question after completing the easier problems.
7. Look through the exam before beginning; plan your work; then begin.
8. Rellox and do well.

$$

b) K for the reaction in 6a above has a value of 290 . Identify the stronger acid and base in the reaction.

$$
\text { acid } \quad \text { base }
$$

c) The pH of a $5.50 \times 10^{-4} \mathrm{M} \mathrm{HClO}_{3}$ solution is about 3.30 . Is $\mathrm{HClO}_{3}$ a strong acid or a weak acid? Explain.
d) Identify the chemical specie(s) in the highest concentration in 6c. (Note: excluding water.)
