Name Section

1 Energy in the form of heat can be either released (exothermic) or absorbed (endothermic) in a chemical reaction. The heat, called enthalpy, is a driving force for chemical reactions. Predict which of the following thermodynamically favored reactions are exothermic and which are endothermic.
a) $\mathrm{H}_{2} \mathrm{O}(l) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ at $25^{\circ} \mathrm{C}$
b) $2 \mathrm{Mg}(s)+\mathrm{O}_{2}(g) \rightarrow 2 \mathrm{MgO}(s)$
exothermic
c) $\mathrm{Ba}(\mathrm{OH})_{2} \cdot 8 \mathrm{H}_{2} \mathrm{O}(s)+2 \mathrm{NH}_{4} \mathrm{Cl}(s) \rightarrow \mathrm{BaCl}_{2}(a q)+2 \mathrm{NH}_{3}(g)+10 \mathrm{H}_{2} \mathrm{O}(l)$
endothermic
d) $\mathrm{H}_{2}(\mathrm{~g})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$ or $(\mathrm{g})$
exothermic
e) $\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$
exothermic
f) $\mathrm{Al}(s)+\frac{3}{2} \mathrm{Br}_{2}(l) \rightarrow \mathrm{AlBr}_{3}(s)$
exothermic
2. A formation reaction is a chemical reaction depicting the formation of one mole of a substance from its naturally occurring elemental sources. Which of the reactions in question 1 are formation reactions?

A formation reaction is characterized as having elements in their standard states forming $1 \mathbf{~ m o l}$ of product.

So d and $f$ are both formation reactions.
d) $\mathrm{H}_{2}(g)+\frac{1}{2} \mathrm{O}_{2}(g) \rightarrow \mathrm{H}_{2} \mathrm{O}(l)$ or $(g)$ and f) $\mathrm{Al}(s)+\frac{3}{2} \mathrm{Br}_{2}(l) \rightarrow \mathrm{AlBr}_{3}(s)$

However, $b$ is NOT a formation reaction
b) $\mathbf{2 M g}(s)+\mathbf{O}_{2}(g) \rightarrow 2 \mathbf{M g O}(s)$

The reactants are in their standard state, however 2 moles of product are formed. For this reaction to be a formation reaction the equation would have to be;

$$
\operatorname{Mg}(s)+\frac{1}{2} \mathrm{O}_{2}(g) \rightarrow \operatorname{MgO}_{(s)}
$$

3. A table of enthalpies of formation, $\Delta \mathbf{H}_{\mathbf{f}}^{\circ}$, for selected substance is at the end of this DCI. Write the mathematical equation which relates the standard heat of reaction to the heats of formation of the reactants and products of the chemical reaction.

The heat (enthalpy) of reaction can be determined by adding together the enthalpies of formation associated with a series of formation reactions which can generate the desired reaction.

$$
\Delta H_{r \times n}^{\circ}=\Sigma \Delta H_{f}^{\circ} \text { (products) }-\Sigma \Delta H_{f}^{\circ}(\text { reactants })
$$

4. Calculate $\Delta \mathrm{H}^{\circ}$ reaction for the following chemical reactions.
a) $\mathrm{H}_{2} \mathrm{O}(l) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$ at $25^{\circ} \mathrm{C}$ (note: this reaction is NOT thermodynamically favored at $25{ }^{\circ} \mathrm{C}$ )

$$
\Delta H_{\mathbf{r x n}}^{\circ} \quad=+44 \mathrm{~kJ} \mathrm{~mol}^{-1}
$$

b) $2 \mathrm{Mg}(s)+\mathrm{O}_{2}(g) \rightarrow 2 \mathrm{MgO}(s)$
$\Delta \mathbf{H}_{\mathbf{r x n}}^{\circ} \quad=\mathbf{- 1 2 0 2} \mathrm{kJ} \mathrm{mol}^{-1}$
c) $\mathrm{Ba}(\mathrm{OH})_{2} \cdot 8 \mathrm{H}_{2} \mathrm{O}(s)+2 \mathrm{NH}_{4} \mathrm{Cl}(s) \rightarrow \mathrm{BaCl}_{2}(a q)+2 \mathrm{NH}_{3}(g)+10 \mathrm{H}_{2} \mathrm{O}(l)$

$$
\begin{aligned}
& \Delta H_{\mathbf{r x n}}^{\circ}=\Sigma \Delta H_{f}^{\circ} \text { (products) }-\Sigma \Delta H_{f}^{\circ}(\text { reactants }) \\
& =\Delta H_{f}^{\circ}\left(\mathrm{BaCl}_{2}\right)+2 \Delta \mathrm{H}_{\mathrm{f}}^{\circ}\left(\mathrm{NH}_{3}\right)+10 \Delta \mathrm{H}_{\mathrm{f}}^{\circ}\left(\mathrm{H}_{2} \mathrm{O}\right) \\
& \\
& \quad-\left(\Delta \mathrm{H}_{\mathrm{f}}^{\circ}\left(\mathrm{Ba}(\mathrm{OH})_{2} \cdot 8 \mathrm{H}_{2} \mathrm{O}\right)+2 \Delta \mathrm{H}_{\mathrm{f}}^{\circ}\left(\mathrm{NH}_{4} \mathrm{Cl}\right)\right) \\
& =\left(-872 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)+2\left(-46 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)+10\left(-286 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)-\left(\left(-3342 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)+2(-\right. \\
& \left.\left.314 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)\right) \\
& =\left(-872 \mathrm{~kJ} \mathrm{~mol}^{-1}+\left(-92 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)+\left(-2860 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)\right)-\left(-3342 \mathrm{~kJ} \mathrm{~mol}^{-1}+\left(-628 \mathrm{~kJ}^{\left.\left.\mathrm{mol}^{-1}\right)\right)}\right.\right. \\
& =146 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{aligned}
$$

d) $\mathrm{H}_{2}(\mathrm{~g})+\frac{1}{2} \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{H}_{2} \mathrm{O}(l)$ or $(\mathrm{g})$
$\Delta \mathbf{H}_{\mathbf{r x n}}^{\circ}=\mathbf{- 2 8 6} \mathrm{kJ} \mathrm{mol}^{-1}$ for the liguid phase and $\mathbf{- 2 4 2} \mathrm{kJ} \mathrm{mol}^{-1}$ for the gas phase
e) $\mathrm{CH}_{4}(\mathrm{~g})+2 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathrm{CO}_{2}(\mathrm{~g})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{l})$

$$
\begin{aligned}
& \Delta H_{\mathrm{rxn}}^{\circ}=\Sigma \Delta \mathrm{H}_{\mathrm{f}}^{\circ} \text { (products) }-\Sigma \Delta \mathrm{H}_{\mathrm{f}}^{\circ}(\text { reactants }) \\
& =\left(\Delta \mathrm{H}_{\mathrm{f}}^{\circ}\left(\mathrm{CO}_{2}\right)+2 \Delta \mathrm{H}_{\mathrm{f}}^{\circ}\left(\mathrm{H}_{2} \mathrm{O}\right)\right)-\left(\Delta \mathrm{H}_{\mathrm{f}}^{\circ}\left(\mathrm{CH}_{4}\right)+2 \Delta \mathrm{H}_{\mathrm{f}}^{\circ}\left(\mathrm{O}_{\mathbf{2}}\right)\right) \\
& =\left[\left(-393.5 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)+\left(-285.8 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)\right]-\left[\left(-74.8 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)+(0)\right] \\
& =-890 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{aligned}
$$

f) $\mathrm{Al}(s)+\frac{3}{2} \mathrm{Br}_{2}(l) \rightarrow \mathrm{AlBr}_{3}(s)$

$$
\begin{aligned}
& \Delta H_{\mathbf{r x n}}^{\circ}=\Sigma \Delta H_{f}^{\circ} \text { (products) }-\Sigma \Delta H_{f}^{\circ}(\text { reactants }) \\
& =\Delta H_{f}^{\circ}\left(\mathrm{AlBr}_{3}\right)-\left[\Delta H_{f}^{\circ}(\mathrm{Al})+\frac{3}{2} \Delta H_{f}^{\circ}\left(\mathrm{Br}_{2}\right)\right] \\
& =\left(-526.3 \mathrm{~kJ} \mathrm{~mol}^{-1}\right)-\left[(0)+\frac{3}{2}(0)\right]=-526.3 \mathrm{~kJ} \mathrm{~mol}^{-1}
\end{aligned}
$$

4. The natural tendency for spontaneous chemical reactions is to release heat. Is enthalpy an absolute predictor of thermodynamically favorability?

No, enthalpy is not an absolute predictor of whether a reaction is thermodynamically favored.
