PS8.1. A 1.00 liter container initially holds 0.257 moles of NOBr at a given temperature. The reaction which occurs is:

$$
2 \mathrm{NOBr}(g) \rightleftarrows 2 \mathrm{NO}(g)+\mathrm{Br}_{2}(g)
$$

At equilibrium analysis shows 0.240 moles of NO and 0.120 moles of $\mathrm{Br}_{2}$.
a) Which direction did the reaction proceed to establish (reach) equilibrium?
b) How many moles of NOBr reacted in order to form 0.240 moles of NO and 0.120 moles of $\mathrm{Br}_{2}$ ?
c) How many moles of NOBr remain after equilibrium was established?
d) What is the magnitude of $\mathrm{K}_{\mathrm{c}}$ ?

PS8.2. In a container, the partial pressure of NOCl is initially 0.340 atm at a given temperature. The chemical equation which describes the reaction is:

$$
2 \mathrm{NO}(g)+\mathrm{Cl}_{2}(g) \rightleftarrows 2 \mathrm{NOCl}_{(g)}
$$

At equilibrium analysis shows the partial pressure of NO is 0.0916 atm.
a) Which direction did the reaction proceed to establish (reach) equilibrium?
b) What is the partial pressure of NOCl which reacted in order for the partial pressure of NO to be 0.0916 atm ?
c) What is the partial pressure of $\mathrm{Cl}_{2}$ at equilibrium?
d) What is the partial pressure of NOCl at equilibrium?
b) What is the magnitude of $\mathrm{K}_{\mathrm{p}}$ for the equation above?

PS8.3. A 1.00 liter container holds 1.06 moles of $\mathrm{H}_{2}$ and 1.57 moles of CO at a temperature of $162{ }^{\circ} \mathrm{C}$. At this temperature, the following reaction occurs,

$$
2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{CO}(\mathrm{~g}) \rightleftarrows \mathrm{CH}_{3} \mathrm{OH}_{(g)}
$$

After equilibrium is established, analysis shows 0.200 moles of $\mathrm{CH}_{3} \mathrm{OH}$ in the container. Calculate the $[\mathrm{CO}]_{\mathrm{eq}},\left[\mathrm{H}_{2}\right]_{\mathrm{eq}}$ and $\mathrm{K}_{\mathrm{c}}$.

PS8.4. The following reaction,

$$
2 \mathrm{HI}(g) \rightleftarrows \mathrm{I}_{2}(g)+\mathrm{H}_{2}(g)
$$

occurs at 298 K . If 2.00 mol of HI are placed into a 1.00 liter container and permitted to react, at equilibrium it is found that $20.0 \%$ of the HI has decomposed. Calculate $\mathrm{K}_{\mathrm{c}}$ and $\mathrm{K}_{\mathrm{p}}$.

PS8.5. A 0.622 gram quantity of $\mathrm{COBr}_{2}$ is sealed in a glass bulb of 0.100 L volume and heated to a temperature of $73^{\circ} \mathrm{C}$. At $73^{\circ} \mathrm{C}$ the $\mathrm{COBr}_{2}$ partially decomposes according to the equation

$$
\mathrm{COBr}_{2(g)} \rightleftarrows \mathrm{CO}(g)+\mathrm{Br}_{2(g)}
$$

for which $\mathrm{K}_{\mathrm{c}}=0.190$. Calculate the concentration of each species at $73^{\circ} \mathrm{C}$.

PS8.6. The equilibrium constant, $K_{p}$, for the reaction

$$
\mathrm{H}_{2} \mathrm{O}(g)+\mathrm{CO}(g) \rightleftarrows \mathrm{CO}_{2}(g)+\mathrm{H}_{2}(g)
$$

is 7.31. Calculate the partial pressure of all species at equilibrium for each of the following original mixtures:
a) 1.0 atm of CO and 1.0 atm of $\mathrm{H}_{2} \mathrm{O}$.

PS8.6. (CONTINUED)
b) 1.0 atm of $\mathrm{CO}, 1.0 \mathrm{~atm}$ of $\mathrm{H}_{2} \mathrm{O}$ and 1.00 atm of $\mathrm{H}_{2}$.
c) 1.0 atm of $\mathrm{H}_{2}$ and 1.0 atm of $\mathrm{CO}_{2}$.

PS8.7. At 1000 K the equilibrium constant, $\mathrm{K}_{\mathrm{c}}$, for the reaction

$$
2 \mathrm{NO}(g)+\mathrm{O}_{2}(g) \rightleftarrows 2 \mathrm{NO}_{2(g)}
$$

is 0.833 . Calculate the concentrations of all species at equilibrium when 0.200 moles of $\mathrm{NO}_{2}$ are placed in a 2.00 L container at 1000 K .

PS8.8. The equilibrium constant, $\mathrm{K}_{\mathrm{p}}$, for the reaction

$$
2 \mathrm{NOBr}(g) \rightleftarrows 2 \mathrm{NO}(g)+\mathrm{Br}_{2}(g)
$$

is 6.25 at $25^{\circ} \mathrm{C}$ and $\Delta \mathrm{H}^{\circ}=34.4 \mathrm{~kJ}$. Calculate the magnitude of the equilibrium constant at $50^{\circ} \mathrm{C}$.

PS8.9. Given the reaction

$$
\mathrm{XeF}_{4}(g) \rightleftarrows \mathrm{Xe}(g)+2 \mathrm{~F}_{2}(g)
$$

A 10.0 liter vessel at 298 K initially contains a sample of $\mathrm{XeF}_{4}$ at 0.750 atm . After the reaction achieves equilibrium, the total pressure in the vessel is 1.95 atm. Calculate $K_{p}$ from this data.

PS8.10. The equilibrium constant, $\mathrm{K}_{\mathrm{c}}$, for the reaction

$$
\mathrm{N}_{2}(g)+\mathrm{O}_{2}(g) \rightleftarrows 2 \mathrm{NO}(g)
$$

is $2.50 \times 10^{-6}$ at a particular temperature. If the $\left[\mathrm{N}_{2}\right]_{\mathrm{o}}=2.00 \mathrm{M}$, the $\left[\mathrm{O}_{2}\right]_{\mathrm{o}}=$ 1.00 M and the $[\mathrm{NO}]_{\mathrm{o}}=0 \mathrm{M}$, calculate the equilibrium concentration of all species.
